-Added GetKey method (modified copy of GetKeyDown method already present there) in CustomInput to operate continuous key pressing

-Looping of the horn sound is still not perfect yet. As we discussed before, problem is apparently in the original horn sounds SA engine was most probably modifying at runtime to better blend.

-I do have concerns about the method MakeSubclip() that is used to create loop-able sample for AudioSource, as it hasn't been tested for leaks yet. There are probably none, but it's a good practice to test it anyways. So should be tested horn AudioSource, since it has to be created additionally (due to new radio implementation which already uses one AudioSource), to prevent more of these components being created on, say, scene loads or whenever Awake is additionally called (but I reckon such scenario is not very common in game like this? I'm thinking this further as I work with RPGs where such scenario is quite common). I'll do all this in future commints.

-There is a doppler effect on horn sound. It sounds good in environment, although the effect is also laudable for the player inside car as well. This can be prevented pretty easily though, I'll implement that in next commit.

Implemented horn sound base functionality

A game that builds on one machine is not ready.

A good Unity DevOps workflow should be ..

Traceable

Every build maps to a branch and commit.

Reviewable

Changes land through pull requests and checks.

Asset-safe

Metadata and large binaries are handled correctly.

Releasable

CI can produce a tester-ready artifact on demand.

**What must Git know
about a Unity project?**

Generated Files, Secrets, Large Files

Library/
Temp/
Obj/
Logs/
Build/
Builds/
UserSettings/

Source, settings, metadata.

Assets/
Packages/
ProjectSettings/
*.meta

What about large non-generated files?

.psd, .fbx, .wav, .mp4 ,large textures..

for .psd, .fbx, .wav, .mp4 ,large textures..

Git LFS=
pointers in Git, heavy content
stored separately

What about secrets?

Keep secrets out of the repo..

secret = token / password / signing values

artifacts = saved build outputs

release = chosen version + notes + builds

How do you keep collaboration safe?

Git history alone is not enough..

- Looping of the horn sounds SA engine was not implemented
- I do have concerns about the method MakeSound, but it hasn't been tested for leaks yet. There are probably none, but I haven't tested horn AudioSource, since it has to be created additionally (due to the one AudioSource), to prevent more of these components being created on, say, scenarios additionally called (but I reckon such scenario is not very common in game like this? I'm thinking with RPGs where such scenario is quite common). I'll do all this in future commits.
- There is a doppler effect on horn sound. It sounds good in environment, although the effect is also laudable for the player inside car as well. This can be prevented pretty easily though, I'll implement that in next commit.

The safe path..

feature/modify-menu → PR → Status Check → Review → Merge to main

Rule

main should stay releasable

Risky work lives on branches until review and validation are done.

What should CI do?

CI (Continuous Integration): automatic validation when code changes

Example workflow..

```
name: unity-ci
on: [pull_request, push]

1) checkout repo
2) pull LFS assets
3) run Unity in batch mode
4) run Edit Mode tests
5) upload artifact
```

search → Github Actions..

In short ..

- Git is for history. DevOps is for repeatable delivery.
- Unity needs correct repo hygiene: .meta files, ignored caches, sensible LFS use.
- Protected main + pull requests + status checks make collaboration safer.
- CI should answer one question quickly: can we trust this change?
